

MTN Customer Segmentation & Churn — Insight Summary

Case study: Using customer data to replace guesswork with evidence-based segmentation | **Customers analyzed:** 496 | **Churn rate:** 29%

The Business Problem

Many Nigerian SMEs make customer decisions by **guessing who their customers are**—who is valuable, who is likely to leave, what customers actually use, and which offers are worth prioritizing. Without structured customer analysis, businesses can spend limited marketing and retention budgets on broad campaigns instead of the customers who need attention most. This project demonstrates a practical way to replace that guesswork with measurable customer segments, KPIs and actionable insights.

How the Project Solves the Problem

The project takes customer-level data through a complete analytics workflow: data cleaning, KPI creation, segmentation, churn analysis, visualization and business interpretation. The resulting Excel and Power BI dashboards allow decision-makers to move from “**Who do we think our customers are?**” to “**What does the data show about our customers?**”.

Key Evidence from the Analysis

- **496 customers analyzed:** establishes a measurable customer base instead of relying on assumptions.
- **350 active and 146 churned customers:** makes retention performance visible and measurable.
- **29% churn rate:** shows the scale of the retention problem and creates a baseline for improvement.
- **Age segmentation:** churn varies across age groups, with the 76–85 group at approximately 48% and the 26–35 group at about 34%.
- **Gender comparison:** female customers show approximately 31% churn versus 28% for male customers, providing a useful supporting segmentation signal.
- **Usage and purchasing behavior:** churned customers remain relatively active, with about 100 GB average data usage versus 98 GB for retained customers and about 11 purchases versus 10.
- **Revenue concentration:** higher-value subscription plans contribute strongly to revenue, highlighting the importance of protecting valuable customers.

Business Recommendations

- **Segment before marketing:** group customers by risk, value, behavior and demographics before deciding who receives an offer.
- **Prioritize high-value/high-risk customers:** focus retention resources where potential revenue loss is greatest.
- **Investigate why active customers still churn:** usage alone does not explain retention, so businesses should examine pricing, service quality, satisfaction and competitor pressure.
- **Use the dashboard as a decision tool:** monitor KPIs and customer segments regularly so retention actions are based on current evidence.

Conclusion

This project demonstrates how a Nigerian SME can move from customer guesswork to data-driven customer understanding. The same approach can be adapted to an SME's own customer, sales or transaction data to identify valuable segments, detect churn risk and make more targeted business decisions. The goal is not simply to produce charts—it is to turn customer data into decisions that can protect revenue and improve retention.

Decision snapshot: 496 customers • 350 active • 146 churned • 29% churn • 96M total revenue • 5K total purchases
